Book Reviews

(Continued from page 1110)

Diseases of the Chest and the Principles of Physical Diagnosis. By George W. Norris, M.D., Professor of Clinical Medicine in the University of Pennsylvania, and Henry R. M. Landis, M.D., Professor of Clinical Medicine, University of Pennsylvania; with a Chapter on the Transmission of Sounds Through the Chest, by Charles M. Montgomery, M.D., and a Chapter on the Electrocardiograph in Heart Disease, by Edward Krumbhaar, Ph.D., M.D. Fourth Edition, Revised. 954 pages with 478 illustrations. Philadelphia and London: W. B. Saunders Company, 1929. Cloth, $10.00 net.

This book has established itself as a medical standard. The authors stress the usefulness of physical diagnosis in the investigation of diseases in the chest and the indications for special methods of investigation. The present edition has been extensively revised and brought up to date. An excellent section on bronchoscopy in the diagnosis of respiratory diseases has been added by Dr. Louis H. Clerf. The original illustrations add to the value of a very useful volume.

Hookworm Disease, Its Distribution, Biology, Epidemiology, Pathology, Diagnosis, Treatment and Control. By Asa C. Chandler, M.Sc., Ph.D., Professor of Biology, Rice Institute, Houston, Texas; Recently Officer-in-Charge, Hookworm Research Laboratory, School of Tropical Medicine and Hygiene, Calcutta, India. 494 pages, illustrated. New York: The Macmillan Company, 1929. Cloth, $5.00.

Full data in all disputed questions is supplied, and hookworm disease is carefully and fully expounded. The book may be used both as a text and a reference, and should establish itself as a text book in schools of hygiene. The illustrations and bibliography are well selected. The sections on diagnosis and treatment are given in sufficient detail to appeal to the practising physician as well as to the student.
